UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS International General Certificate of Secondary Education

0620/03	Paper 3 (Extended)	
May/June 2005 1 hour 15 minutes	Candidates answer on the Question Paper No Additional Materials required.	
		Candidate Name
Candidate Number		Centre Number

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs or rough working.

WRITE IN THE BOXES PROVIDED ON THE QUESTION PAPER

DO NOT WRITE IN THE BARCODE.

DO NOT WRITE IN THE GREY AREAS BETWEEN THE PAGES.

Do not use staples, paper clips, highlighters, glue or correction fluid.

You may use a calculator.

Answer all questions.

The number of marks is given in brackets [] at the end of each question or part questions.

A copy of the Periodic Table is printed on page 16.

Total	

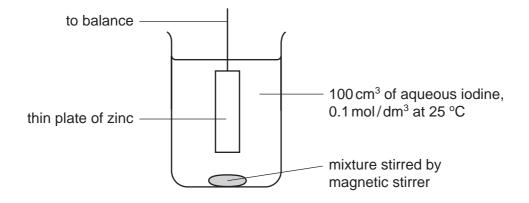

1	Thre	ee o	f the halogens in Group VII are: chlorine bromine iodine	For Examiner's Use
	(a)	(i)	How does their colour change down the Group?	
			[1]	
		(ii)	How does their physical state (solid, liquid or gas) change down the Group?	
			[1]	
	((iii)	Predict the colour and physical state of fluorine.	
			colour	
			physical state [2]	
	(b)		scribe how you could distinguish between aqueous potassium bromide and aqueous assium iodide.	
		test		
		resi	ult with bromide	
		resi	ult with iodide [3]	
	(c)		15 moles of iodine react with 0.045 moles of chlorine to form 0.030 moles of a single duct. Complete the equation.	
		I ₂	+ C _{l2} -> [2]	
	(d)		ces of chlorine can be separated from bromine vapour by diffusion. ich gas would diffuse the faster and why?	
			[2]

2 The following apparatus was used to measure the rate of the reaction between zinc and iodine.

For Examiner's Use

[3]

The mass of the zinc plate was measured every minute until the reaction was complete.

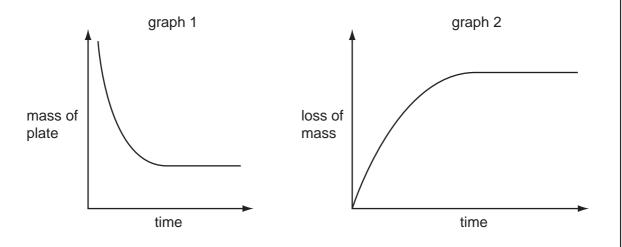

` '	Write an ionic iodine molecule	•	for the	redox	reaction	that	occurred	between	zinc	atoms	and
											[2]

(b)	Describe how you could show by adding aqueous sodium hydroxide and aqueous ammonia that a solution contained zinc ions.
	result with sodium hydroxide
	excess sodium hydroxide
	result with aqueous ammonia

excess aqueous ammonia

(c) From the results of this experiment two graphs were plotted.

For Examiner's Use

(i) Which reagent iodine or zinc was in excess? Give a reason for your choice.

[1]

(ii) Describe how the shape of graph 1 would change if 100cm³ of 0.05 mol/dm³ iodine had been used.

[2]

(iii) On graph 2, sketch the shape if the reaction had been carried out using 100 cm³ of 0.1 mol/dm³ iodine at 35 °C instead of at 25 °C. [2]

			Korean chemist has discovered a cure for smelly socks. Small particles of silver are d to a polymer, poly(propene), and this is woven into the socks.	For Examiner Use
(;	a) ((i)	Give the structural formula of the monomer.	
	(i	ii)	[1] Draw the structural formula of the polymer.	
	(ii	ii)	[2] Suggest which one, monomer or polymer, will react with aqueous bromine and why?	
			[2]	
(1	7	The silve	show that the polymer contains silver the following test was carried out. It polymer fibres were chopped into small pieces and warmed with nitric acid. The er atoms were oxidised to silver(I) ions. The mixture was filtered. Aqueous sodium oride was added to the filtrate and a white precipitate formed.	
			Why was the mixture filtered?	
	(i	ii)	Explain why the change of silver atoms to silver ions is oxidation.	
			[1]	
	(ii	ii)	· · ·	

(c)	to b	The unpleasant smell is caused by carboxylic acids. Bacteria cause the fats on the skin be hydrolysed to these acids. Silver kills the bacteria and prevents the hydrolysis of ne fats.				
	(i)	Fats are esters. Give the name and structural formula of an ester.				
		name	[1]			
		structural formula				
			[1]			
	(ii)	Complete the word equation. Ester + water → carboxylic acid +	[1]			
(d)	Pro	panoic acid is a weak acid.				
	(i)	The following equation represents its reaction with ammonia.				
		$CH_3-CH_2-COOH + NH_3 \longrightarrow CH_3-CH_2-COO^- + NH_4^+$				
		Explain why propanoic acid behaves as an acid and ammonia as a base.				
			[3]			
	(ii)	Explain the expression weak acid.				
			[1]

of these	The Carlsbad caverns in New Mexico are very large underground caves. Although the walls of these caves are coated with gypsum (hydrated calcium sulphate), the caves have been formed in limestone.						
(a) It is	believed that the caves were formed by sulphuric acid reacting with the limestone.						
(i)	Complete the word equation.						
	calcium + sulphuric → calcium + + + + + carbonate acid sulphate [1]						
(ii)	Describe how you could test the water entering the cave to show that it contained sulphate ions.						
	test						
	result [2]						
(iii)	How could you show that the water entering the cave has a high concentration of hydrogen ions?						
	[1]						
	drogen sulphide gas which was escaping from nearby petroleum deposits was being dised to sulphuric acid.						
(i)	Complete the equation for this reaction forming sulphuric acid.						
	$H_2S + O_2 \longrightarrow$ [2]						
(ii)	Explain why all the hydrogen sulphide should be removed from the petroleum before it is used as a fuel.						
	[1]						

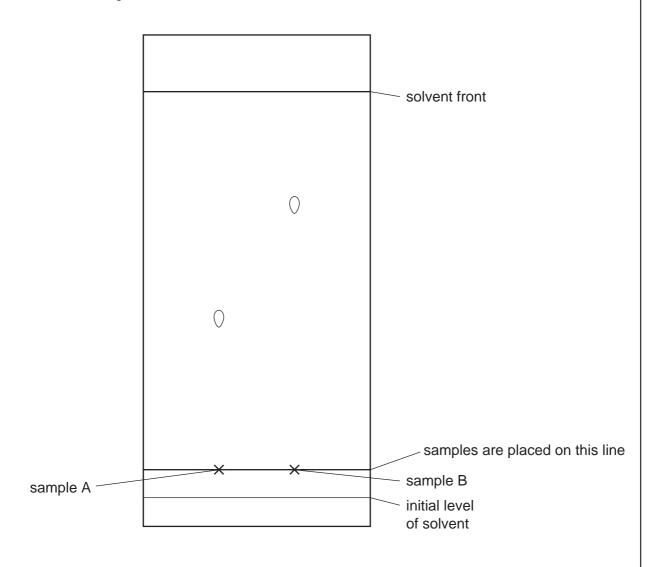

(iii) Draw a diagram to show the arrangement of the valency electrons in one molecule

		of the covalent compound hydrogen sulphide. Use o to represent an electron from a sulphur atom. Use x to represent an electron from a hydrogen atom.	Examiner's Use
		[2]	
(c)		phuric acid is manufactured by the Contact Process. Sulphur dioxide is oxidised to phur trioxide by oxygen.	
		$2SO_2 + O_2 \longrightarrow 2SO_3$	
	(i)	Name the catalyst used in this reaction.	
		[1]	
	(ii)	What temperature is used for this reaction?	
		[1]	
	(iii)	Describe how sulphur trioxide is changed into sulphuric acid.	
		[2]	
		[2]	
(d)		psum is hydrated calcium sulphate, $CaSO_4.xH_2O$. It contains 20.9% water by mass. culate x.	
	M _r :	CaSO ₄ , 136; H ₂ O, 18.	
	79.	1g of CaSO ₄ =moles	
	20.	9 g of H ₂ O =moles	
	x =	[3]

5	Enzymes	are	biological	catalysts.	They	are	used	both	in	research	laboratories	and	in
	industry.												

(a) Enzymes called proteases can hydrolyse proteins to amino acids. The amino acids can be separated and identified by chromatography. The diagram below shows a typical chromatogram.

(i) The R_f value of a sample = <u>distance travelled by sample</u> distance travelled by solvent front

Some R_f values for amino acids are:

glutamic acid = 0.4 glycine = 0.5

alanine = 0.7

leucine = 0.9

Identify the two amino acids on the chromatogram.

A is ______ B is _____ [2]

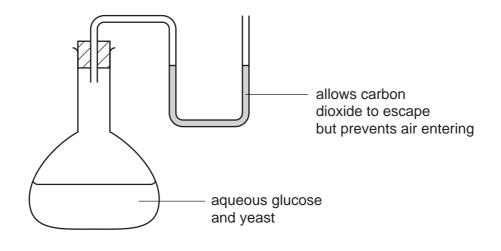

(ii) Explain why the chromatogram must be exposed to a locating agent before $R_{\rm f}$ values can be measured.

[1]

	(iii)	Measuring $R_{\rm f}$ values is one way of identifying amino acids on a chromatogra Suggest another.	am.	For Examiner's Use
			[1]	
	(iv)	The synthetic polymer, nylon, has the same linkage as proteins. Draw the structiformula of nylon.	ural	
			[3]	
			[O]	
(b)		cymes called carbohydrases can hydrolyse complex carbohydrates to simple sug		
		bohydrate.	<i>nox</i>	
			[2]	

© UCLES 2005 0620/03/M/J/05 (c) Fermentation can be carried out in the apparatus drawn below. After a few days the reaction stops. It has produced a 12% aqueous solution of ethanol.

For Examiner's Use

(i) Complete the equation.

$C_6H_{12}O_6$	→	+	
glucose	ethanol	carbon dioxide	[2]

(ii) Zymase catalyses the anaerobic respiration of glucose. Define the term respiration.

[2]

(iii) Suggest a reason why the reaction stops after a few days.

5 A T

(iv) Why is it essential that there is no oxygen in the flask?

		[4]
		111
		L.1

(v) What technique is used to concentrate the aqueous ethanol?

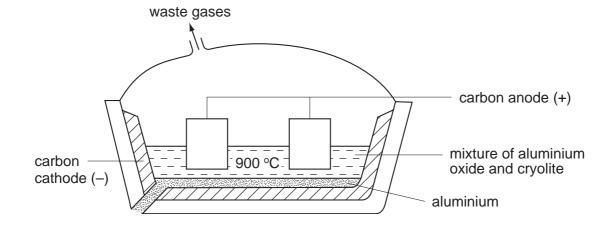

[1	1
 ь.	4

6 The position of aluminium in the reactivity series of metals is shown below.

For Examiner's Use

magnesium aluminium zinc copper

(a) Aluminium is extracted by the electrolysis of its molten oxide.

(i)	Name	the	main	ore	of	aluminium
-----	------	-----	------	-----	----	-----------

Γ1	11
L	,]

(ii) Why does the molten electrolyte contain cryolite?

(iii) Oxygen is produced at the positive electrode (anode). Name another gas which is given off at this electrode.

(b) Aluminium reacts very slowly with aqueous copper(II) sulphate.

$$2Al(s) + 3CuSO_4(aq) \longrightarrow Al_2(SO_4)_3(aq) + 3Cu(s)$$

(i) Which of the two metals has the greater tendency to form ions?

(ii) Describe what you would see when this reaction occurs.

(iii) Explain why aluminium reacts so slowly.

(c)	Complete	the	following	table	by	writing	"reaction"	or	"no	reaction"	in	the	spaces
	provided.												

oxide	type of oxide	reaction with acid	reaction with alkali
magnesium	basic		
aluminium	amphoteric		

41	

(d)	Predict the ed	uations f	or the	decom	position	of the	following	aluminium	compounds

(i)	A <i>l</i> (OH) ₃ →		+	[2	2]
-----	--------------------------------	--	---	----	----
