

Leave blank

1. A car of mass 1200 kg moves along a straight horizontal road. The resistance to motion of the car from non-gravitational forces is of constant magnitude 600 N. The car moves with constant speed and the engine of the car is working at a rate of 21 kW.

(a) Find the speed of the car. **(3)**

The car moves up a hill inclined at an angle α to the horizontal, where $\sin \alpha = \frac{1}{14}$.

The car's engine continues to work at 21 kW, and the resistance to motion from non-gravitational forces remains of magnitude 600 N.

(b) Find the constant speed at which the car can move up the hill. **(4)**

Leave blank

2.

Figure 1

A thin uniform wire, of total length 20 cm, is bent to form a frame. The frame is in the shape of a trapezium $ABCD$, where $AB = AD = 4$ cm, $CD = 5$ cm, and AB is perpendicular to BC and AD , as shown in Figure 1.

(a) Find the distance of the centre of mass of the frame from AB . **(5)**

The frame has mass M . A particle of mass kM is attached to the frame at C . When the frame is freely suspended from the mid-point of BC , the frame hangs in equilibrium with BC horizontal.

(b) Find the value of k . **(3)**

5. Two small spheres A and B have mass $3m$ and $2m$ respectively. They are moving towards each other in opposite directions on a smooth horizontal plane, both with speed $2u$, when they collide directly. As a result of the collision, the direction of motion of B is reversed and its speed is unchanged.

(a) Find the coefficient of restitution between the spheres. (7)

Subsequently, B collides directly with another small sphere C of mass $5m$ which is at rest. The coefficient of restitution between B and C is $\frac{3}{5}$.

(b) Show that, after B collides with C , there will be no further collisions between the spheres. (7)

Horizontal lines for writing the answer to question (b).

6.

Figure 2

A uniform pole AB , of mass 30 kg and length 3 m, is smoothly hinged to a vertical wall at one end A . The pole is held in equilibrium in a horizontal position by a light rod CD . One end C of the rod is fixed to the wall vertically below A . The other end D is freely jointed to the pole so that $\angle ACD = 30^\circ$ and $AD = 0.5$ m, as shown in Figure 2. Find

- (a) the thrust in the rod CD , (4)
- (b) the magnitude of the force exerted by the wall on the pole at A . (6)

The rod CD is removed and replaced by a longer light rod CM , where M is the mid-point of AB . The rod is freely jointed to the pole at M . The pole AB remains in equilibrium in a horizontal position.

- (c) Show that the force exerted by the wall on the pole at A now acts horizontally. (2)

7. At a demolition site, bricks slide down a straight chute into a container. The chute is rough and is inclined at an angle of 30° to the horizontal. The distance travelled down the chute by each brick is 8 m. A brick of mass 3 kg is released from rest at the top of the chute. When it reaches the bottom of the chute, its speed is 5 m s^{-1} .

(a) Find the potential energy lost by the brick in moving down the chute. (2)

(b) By using the work-energy principle, or otherwise, find the constant frictional force acting on the brick as it moves down the chute. (5)

(c) Hence find the coefficient of friction between the brick and the chute. (3)

Another brick of mass 3 kg slides down the chute. This brick is given an initial speed of 2 m s^{-1} at the top of the chute.

(d) Find the speed of this brick when it reaches the bottom of the chute. (5)

Lined area for student answers.
