UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS General Certificate of Education

Advanced Subsidiary Level and Advanced Level

CHEMISTRY

Paper 2 Structured Questions AS Core

October/November 2006

1 hour 15 minutes

Candidates answer on the Question Paper. Additional Materials: Data Booklet

Candidate Name							
Centre				Candidate			
Centre Number				Number			

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all work you hand in.

Write in dark blue or black pen.

You may use a pencil for any diagrams, graphs, or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

Answer all questions.

You may lose marks if you do not show your working or if you do not use appropriate units.

A Data Booklet is provided.

The number of marks is given in brackets [] at the end of each question or part question.

At the end of the examination, fasten all your work securely together.

For Exam	iner's Use

This document consists of 11 printed pages and 1 blank page.

Answer all the questions in the spaces provided.

For Examiner's Use

1 In the 19th and 20th centuries, scientists established the atomic theory and showed that three sub-atomic particles, electron, neutron and proton, exist. The masses and charges of these three particles were subsequently determined.

When separate beams of electrons, neutrons or protons are passed through an electric field in the apparatus below, they behave differently.

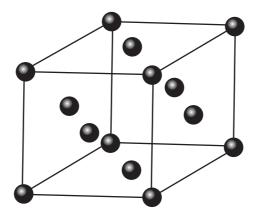

(a) (i)	Which of these three particles will be deflected the most by the electric field?
(ii)	In which direction will this particle be deflected?
(iii)	Explain your answer.
	[4]
(b) (i)	Define the term <i>proton number</i> .
(ii)	Why is the proton number of an atom of an element usually different from the nucleon number of an atom of the element?
	[2]

C)	of artificial elements. In such processes, protons or neutrons are accelerated to high speeds and then fired like 'bullets' at the nucleus of an atom of an element.	For Examiner's Use
	Suggest why neutrons are more effective than protons as 'nuclear bullets'.	
	[2]	
d)	In some cases, when neutrons are fired at atoms of an element, the neutrons become part of the nucleus of those atoms.	
	What effect does the presence of an extra neutron have on the chemical properties of the new atoms formed? Explain your answer.	
	[2]	
	[Total: 10]	

2 Copper and iodine are both solids which have different physical and chemical properties. Each element has the same face-centred crystal structure which is shown below.

For Examiner's Use

The particles present in such a crystal may be atoms, molecules, anions or cations. In the diagram above, the particles present are represented by ...

(a)	Whi	ch type of particles are present in the iodine crystal? Give their formula.	
	part	icle	
	form	nula[2	2]
(b)		en separate samples of copper or iodine are heated to 50°C, the copper remains a lid while the iodine turns into a vapour.	S
	(i)	Explain, in terms of the forces present in the solid structure, why copper remains solid at $50^{\circ}\text{C}.$	а
	(ii)	Explain, in terms of the forces present in the solid structure, why iodine turns into vapour when heated to 50°C .	а
		[2	 1]

(c)	(i)	Although copper is a relatively unreactive metal, when it is heated to a high temperature in an excess of chlorine, copper(II) chloride is formed.	For Examiner Use
		How does chlorine behave in this reaction?	
	(ii)	When a mixture of copper and iodine is heated to a high temperature, no reaction occurs.	
		Suggest a reason for this difference.

(b)	Use	the elements shown opposite to answer the following questions.
	(i)	Give the formulae of two acidic oxides formed by the same element.
		and
	(ii)	Give the name or formula of an oxide that is amphoteric.
	(iii)	Identify an element whose oxide dissolves readily in water to give a strongly alkaline solution.
	(iv)	Identify an element in Period 3 (Na to Ar) whose chloride dissolves in water to give a neutral solution.
	(v)	Identify an element that reacts with water to give a solution that can behave as an oxidising agent.

Octadecane, $C_{18}H_{38}$, is a long chain hydrocarbon which is present in crude oil. Such long chain hydrocarbons are 'cracked' to produce alkanes and alkenes which have smaller molecules. (a) Give two different conditions under which long chain molecules may be cracked. **(b)** Octadecane, C₁₈H₃₈, can be cracked to form hexane and an alkene. Write a balanced equation for this reaction. Alkenes are important industrially because the C=C bond makes them very reactive. **(c)** Ethene reacts with bromine to give 1,2-dibromoethane. What type of reaction is this? (ii) Outline the mechanism of this reaction, giving the structure of the intermediate. Show clearly any relevant dipoles, charges and lone pairs of electrons. $H \subset C - C = Br$ C = CBr
