In Physics (WPH16)
Subject title
Unit 6: Paper 1 Practical Skills in Physics II

Monday 10 May 2021

NOTICE TO CANDIDATES

Please be advised that there is a printing error on page 13 of this paper.

In Q4 (c) (iii) the question should read:

Show that the uncertainty in $d^2 + (t - x)^2$ is approximately 0.11 cm^2 .

All other questions/figures on the paper have been printed correctly.

Please accept our apologies for this error.

**Do NOT write on this notice, it will not be marked.
Please write all responses on the Question Paper.
Please do NOT return the erratum notice to Pearson.**

Please check the examination details below before entering your candidate information

Candidate surname		Other names	
Pearson Edexcel International Advanced Level		Centre Number	Candidate Number
Time 1 hour 20 minutes		Paper reference	WPH16/01
Physics International Advanced Level UNIT 6: Practical Skills in Physics II			
You must have: Scientific calculator, ruler			Total Marks

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
– *there may be more space than you need.*
- **Show all your working out in calculations and include units where appropriate.**

Information

- The total mark for this paper is 50.
- The marks for **each** question are shown in brackets
– *use this as a guide as to how much time to spend on each question.*
- The list of data, formulae and relationships is printed at the end of this booklet.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
- Good luck with your examination.

1/1/1/1/

Answer ALL questions.

- 1 The time period of a rotating wheel can be determined using the apparatus shown.

A magnet is attached to the edge of the wheel. When the magnet passes the coil, a single pulse is displayed on the oscilloscope screen.

The horizontal axis of the oscilloscope screen represents time. The number of milliseconds per division on the horizontal scale can be adjusted.

- (a) As the wheel rotates, a series of pulses is displayed as shown.

Describe how a value of the time period should be determined from these pulses.

(3)

.....

.....

.....

.....

.....

(b) When the wheel is tested, the speed of the magnet is 22.2 ms^{-1} .

The oscilloscope can be adjusted to give the following values for the horizontal scale.

millisecond per division	1	2	5	10
--------------------------	---	---	---	----

Explain which of these scales would display two complete pulses on the screen.

wheel diameter = 25.4 cm

(4)

.....

.....

.....

.....

.....

.....

.....

.....

(Total for Question 1 = 7 marks)

- 2 The specific latent heat of vaporisation L of water can be determined using the apparatus shown.

- (a) Devise a plan to determine the value of L using a graphical method.
You should include a circuit diagram and any additional apparatus required.

- 3 A student investigated the horizontal oscillations of a trolley between two springs using the apparatus shown.

- (a) The student used a stop clock to time the oscillations.

- (i) Describe how he should modify the equipment to make his measurements as accurate as possible.

(2)

.....

.....

.....

.....

- (ii) Describe two techniques he should use to reduce the uncertainty in the value of the time period.

- 4 A student measured some dimensions of a thick, circular lens. The diagram shows approximate values of these dimensions.

- (a) (i) The student had a set of Vernier calipers and a micrometer screw gauge, as shown in the photograph.

State, with a reason, which of these measuring instruments she should use to measure the diameter d of the lens.

(1)

(ii) The student recorded the following values of d , measured at different points across the lens.

5.10 cm 5.11 cm 5.10 cm

She concluded that because her measurements were precise, they must be accurate.
Explain why this conclusion may not be justified.

(2)

.....

.....

.....

.....

(b) The student measured the thickness x of the edge of the lens using the micrometer screw gauge.

She recorded the following measurements.

x/mm				
2.11	2.10	2.13	2.14	2.11

Calculate the mean value of x in mm and its uncertainty.

(2)

.....

.....

.....

.....

Mean value of x = mm $\pm$ mm

(c) The refractive index n of the material of the lens can be determined using

$$n = 1 + \frac{d^2 + (t - x)^2}{8f(t - x)}$$

where f is the focal length of the lens.

(i) Determine the value of n .

$$d = 5.10 \text{ cm} \pm 0.01 \text{ cm}$$

$$t = 8.30 \text{ mm} \pm 0.01 \text{ mm}$$

$$f = 9.8 \text{ cm} \pm 0.3 \text{ cm}$$

(2)

$$n = \dots\dots\dots$$

(ii) Show that the percentage uncertainty in $(t - x)$ is approximately 0.5%.

(2)

(iii) Show that the uncertainty in $d^2 + (t - x)^2$ is approximately 0.11 cm.
